QUESTION NO: 1

What is true about automating interactions with Anypoint Platform using tools such as Anypoint Platform REST APIs, Anypoint CLI, or the Mule Maven plugin?

- A.** Access to Anypoint Platform APIs and Anypoint CLI can be controlled separately through the roles and permissions in Anypoint Platform, so that specific users can get access to Anypoint CLI while others get access to the platform APIs.
- B.** Anypoint Platform APIs can ONLY automate interactions with CloudHub, while the Mule Maven plugin is required for deployment to customer-hosted Mule runtimes
- C.** By default, the Anypoint CLI and Mule Maven plugin are NOT included in the Mule runtime, so are NOT available to be used by deployed Mule applications.
- D.** API policies can be applied to the Anypoint Platform APIs so that ONLY certain LOBs have access to specific functions.

ANSWER: C**QUESTION NO: 2**

An API has been updated in Anypoint Exchange by its API producer from version 3.1.1 to 3.2.0 following accepted semantic versioning practices and the changes have been communicated via the API's public portal.

The API endpoint does NOT change in the new version.

How should the developer of an API client respond to this change?

- A.** The update should be identified as a project risk and full regression testing of the functionality that uses this API should be run.
- B.** The API producer should be contacted to understand the change to existing functionality.
- C.** The API producer should be requested to run the old version in parallel with the new one.
- D.** The API client code ONLY needs to be changed if it needs to take advantage of new features.

ANSWER: D**Explanation:**

Reference: <https://docs.mulesoft.com/exchange/to-change-raml-version>

QUESTION NO: 3

What is most likely NOT a characteristic of an integration test for a REST API implementation?

- A. The test needs all source and/or target systems configured and accessible.
- B. The test runs immediately after the Mule application has been compiled and packaged.
- C. The test is triggered by an external HTTP request.
- D. The test prepares a known request payload and validates the response payload.

ANSWER: D

QUESTION NO: 4

When must an API implementation be deployed to an Anypoint VPC?

- A. When the API implementation must invoke publicly exposed services that are deployed outside of CloudHub in a customer-managed AWS instance.
- B. When the API implementation must be accessible within a subnet of a restricted customer-hosted network that does not allow public access.
- C. When the API implementation must be deployed to a production AWS VPC using the Mule Maven plugin
- D. When the API implementation must write to a persistent Object Store

ANSWER: A

QUESTION NO: 5

What best explains the use of auto-discovery in API implementations?

- A. It makes API Manager aware of API implementations and hence enables it to enforce policies.
- B. It enables Anypoint Studio to discover API definitions configured in Anypoint Platform.
- C. It enables Anypoint Exchange to discover assets and makes them available for reuse.
- D. It enables Anypoint Analytics to gain insight into the usage of APIs.

ANSWER: A

Explanation:

Reference: <https://docs.mulesoft.com/api-manager/2.x/api-auto-discovery-new-concept>

QUESTION NO: 6

An Order API must be designed that contains significant amounts of integration logic and involves the invocation of the Product API.

The power relationship between Order API and Product API is one of “Customer/Supplier”, because the Product API is used heavily throughout the organization and is developed by a dedicated development team located in the office of the CTO.

What strategy should be used to deal with the API data model of the Product API within the Order API?

- A.** Convince the development team of the Product API to adopt the API data model of the Order API such that the integration logic of the Order API can work with one consistent internal data model.
- B.** Work with the API data types of the Product API directly when implementing the integration logic of the Order API such that the Order API uses the same (unchanged) data types as the Product API.
- C.** Implement an anti-corruption layer in the Order API that transforms the Product API data model into internal data types of the Order API.
- D.** Start an organization-wide data modeling initiative that will result in an Enterprise Data Model that will then be used in both the Product API and the Order API.

ANSWER: C

QUESTION NO: 7

What should be ensured before sharing an API through a public Anypoint Exchange portal?

- A.** The visibility level of the API instances of that API that need to be publicly accessible should be set to public visibility.
- B.** The users needing access to the API should be added to the appropriate role in Anypoint Platform.
- C.** The API should be functional with at least an initial implementation deployed and accessible for users to interact with.
- D.** The API should be secured using one of the supported authentication/authorization mechanisms to ensure that data is not compromised.

ANSWER: A

Explanation:

Reference: <https://docs.mulesoft.com/exchange/to-share-api-asset-to-portal>

QUESTION NO: 8

An organization has implemented a Customer Address API to retrieve customer address information. This API has been deployed to multiple environments and has been configured to enforce client IDs everywhere.

A developer is writing a client application to allow a user to update their address. The developer has found the Customer Address API in Anypoint Exchange and wants to use it in their client application.

What step of gaining access to the API can be performed automatically by Anypoint Platform?

- A. Approve the client application request for the chosen SLA tier.
- B. Request access to the appropriate API instances deployed to multiple environments using the client application's credentials.
- C. Modify the client application to call the API using the client application's credentials.
- D. Create a new application in Anypoint Exchange for requesting access to the API.

ANSWER: B

QUESTION NO: 9

An API implementation is deployed to CloudHub.

What conditions can be alerted on using the default Anypoint Platform functionality, where the alert conditions depend on the end-to-end request processing of the API implementation?

- A. When the API is invoked by an unrecognized API client
- B. When a particular API client invokes the API too often within a given time period
- C. When the response time of API invocations exceeds a threshold
- D. When the API receives a very high number of API invocations

ANSWER: C

Explanation:

Reference: <https://docs.mulesoft.com/api-manager/2.x/using-api-alerts>

QUESTION NO: 10

The responses to some HTTP requests can be cached depending on the HTTP verb used in the request.

According to the HTTP specification, for what HTTP verbs is this safe to do?

- A. PUT, POST, DELETE
- B. GET, HEAD, POST
- C. GET, PUT, OPTIONS
- D. GET, OPTIONS, HEAD

ANSWER: D

Explanation:

Reference: <http://restcookbook.com/HTTP%20Methods/idempotency/>
